Project Name: CSAT Analytics (PRDA - 02)
Student Name: Pooja Gupta

CSAT Analytics - Executive Summary & Key Insights

1. Primary Call Drivers:

Billing Questions account for the vast majority of customer inquiries (around 23K+ calls out of 32.9K). Inquiries regarding Payments and Service Outage are comparatively very low.

2. Response Time & SLA Performance:

The majority of calls (~20.6K) are resolved Within SLA. Around 8.1K calls are Below SLA, while 4.2K calls exceed the time limit (Above SLA / SLA breach).

3. Communication Channel Distribution:

Call-Center handles the highest volume of calls (10.64K / ~32.3%). Digital channels handle the remaining load: Chatbot (8.26K), Email (7.47K), and Web (6.58K).

4. Call Volume Trends Over Time:

Call volume fluctuates daily throughout the month, reaching peak loads of up to 1,132 calls per day.

5. Geographic Distribution:

Inquiries are spread across the US, with higher call concentrations coming from densely populated states like California.

Recommendations & Suggestions for the Company:

1. Automate Billing Support: Since Billing Questions drive over 70% of call volume, enhancing the Chatbot workflows and FAQ portal will significantly reduce direct agent calls.

2. Improve CSAT Scores: The average CSAT score is currently 2.07. Reducing the 4.2K Above SLA delays will directly help improve overall customer satisfaction scores.
